

What kind of performance issue?

**Where is it in the source code?
In what call-tree context?**

How are values distributed across processes / threads? (topology or tree-based view)

Set metric value display mode

Colour coding according to metric severity value and actual display mode

**Severest instances
marked by boxes
or icons**

**Context menus via
right mouse button**

**Details of selected thread
on right mouse button**

More topology controls found in toolbar menu

Metric minimum value
(selected mode/absolute)

**Selected call-path value
(selected mode/absolute/
percentage of total value)**

Metric total value
(selected mode/absolute)
